**1-PHENYL-BENZIMIDAZOLE COMPOUNDS AND THEIR USE AS GABA<sub>A</sub> RECEPTOR MODULATORS****TECHNICAL FIELD**

5

The present invention relates to novel benzimidazole compounds, pharmaceutical compositions containing these compounds, methods of treating therewith, and to method of preparing such benzimidazole compounds. The novel compounds of the invention are useful in the treatment of central nervous system 10 diseases and disorders, which are responsive to modulation of the GABA<sub>A</sub> receptor complex, such as for example anxiety, sleep disorders, anaesthesia, memory disorders, and epilepsy or other convulsive disorders.

15

**BACKGROUND ART**

GABA<sub>A</sub> receptors for  $\gamma$ -aminobutyric acid (GABA) are the most abundant inhibitory receptors in the mammalian brain. The GABA<sub>A</sub> receptors are structurally constituted as macromolecular heteropentameric assemblies (combinations of  $\alpha$ ,  $\beta$ , 20 and  $\gamma/\delta$  protein subunits). Several subtypes of such GABA<sub>A</sub> receptors have been described by techniques of modern molecular biology.

Each GABA<sub>A</sub> receptor complex comprises a chloride ion channel that controls chloride flux across the neuronal membrane, and multiple recognition sites for small modulatory molecules such as benzodiazepines, barbiturates, picrotoxin, and 25 certain steroids. When GABA interacts with its receptor, the ion channel is opened, chloride influx is enhanced, the membrane is hyperpolarized and the cell becomes less responsive to excitatory stimuli. This GABA induced ion current can be regulated by diverse agents, including agents that interact with the benzodiazepine receptor or recognition site.

30 Agents that bind or interact with the modulatory sites on the GABA<sub>A</sub> receptor complex, such as for example the benzodiazepine receptor, can have either enhancing effect on the action of GABA, i.e. a positive modulatory effect of the receptor (agonists, partial agonists), an attenuating effect on the action of GABA, i.e.

negative modulation of the receptor (inverse agonists, partial inverse agonists), or they can block the effect of both agonists and inverse agonists by competitive block (antagonists or ligands without intrinsic activity).

Agonists generally produce muscle relaxant, hypnotic, sedative, anxiolytic,  
5 and/or anticonvulsant effects, while inverse agonists produce proconvulsant, anti-inebriant, and anxiogenic effects. Compounds with anxiolytic effects but without or with reduced muscle relaxant, hypnotic and sedative effects are characterised as partial agonists. Partial inverse agonists are considered to be useful as cognition enhancers.

Numerous compounds belonging to different chemical series of compounds  
10 having affinity for the benzodiazepine receptors have been synthesized during the last three decades. However, although the benzodiazepine receptor sites are still considered as very attractive biological sites for interfering with the CNS to treat various disorders and diseases, then nearly all previously synthesized compounds acting at these receptor sites have failed during clinical development because of  
15 unacceptable side effects.

### Steric Isomers

Some of the chemical compounds of the present invention exist in (+) and (-) forms as well as in racemic forms.

Racemic forms can be resolved into the optical antipodes by known methods, for example, by separation of diastereomeric salts thereof, with an optically active acid, and liberating the optically active amine compound by treatment with a base. Another method for resolving racemates into the optical antipodes is based upon chromatography on an optical active matrix. Racemic compounds of the present invention can thus be resolved into their optical antipodes, e.g., by fractional crystallisation of d- or l- (tartrates, mandelates, or camphorsulphonate) salts for example.

The chemical compounds of the present invention may also be resolved by the formation of diastereomeric amides by reaction of the chemical compounds of the present invention with an optically active activated carboxylic acid such as that derived from (+) or (-) phenylalanine, (+) or (-) phenylglycine, (+) or (-) camphanic acid or by the formation of diastereomeric carbamates by reaction of the chemical compound of the present invention with an optically active chloroformate or the like.

Additional methods for the resolving the optical isomers are known in the art. Such methods include those described by Jaques J, Collet A, & Wilen S in "Enantiomers, Racemates, and Resolutions", John Wiley and Sons, New York (1981).

Moreover, being oximes, the chemical compounds of the invention may exist in two forms, syn- and anti-form (Z- and E-form), depending on the arrangement of the substituents around the -C=N- double bond. A chemical compound of the present invention may thus be the syn- or the anti-form (Z- and E-form), or it may be a mixture hereof.

### Pharmaceutically Acceptable Salts

The novel benzimidazole derivatives of the invention may be provided in any form suitable for the intended administration. Suitable forms include pharmaceutically (i.e. physiologically) acceptable salts.

Examples of pharmaceutically acceptable addition salts include inorganic and organic acid addition salts such as the hydrochloride, hydrobromide, phosphate, nitrate, perchlorate, sulphate, citrate, lactate, tartrate, maleate, fumarate, mandelate,

benzoate, ascorbate, cinnamate, benzenesulfonate, methanesulfonate, stearate, succinate, glutamate, glycollate, toluene-p-sulphonate, formate, malonate, naphthalene-2-sulphonate, salicylate and the acetate. Such salts are formed by procedures well known in the art.

5 Other acids such as oxalic acid, while not in themselves pharmaceutically acceptable, may be useful in the preparation of salts useful as intermediates in obtaining a chemical compound of the invention and its pharmaceutically acceptable acid addition salt.

Metal salts of a chemical compound of the invention includes alkali metal  
10 salts, such as the sodium salt, of a chemical compound of the invention containing a carboxy group.

The chemical compound of the invention may be provided in solved or dissolved form together with a pharmaceutically acceptable solvents such as water, ethanol and the like. In general, solved forms are considered equivalent to dissolved  
15 forms for the purposes of this invention.

### Pharmaceutical Compositions

In another aspect the invention provides novel pharmaceutical compositions comprising a therapeutically effective amount of the chemical compound of the  
20 invention. While a chemical compound of the invention for use in therapy may be administered in the form of the raw chemical compound, it is preferred to introduce the active ingredient, optionally in the form of a physiologically acceptable salt in a pharmaceutical composition together with one or more excipients, carriers and/or diluents.

25 In a preferred embodiment, the invention provides pharmaceutical compositions comprising the chemical compound of the invention or a pharmaceutically acceptable salt or derivative thereof together with one or more pharmaceutically acceptable carriers therefor and, optionally, other therapeutic and/or prophylactic ingredients. The carrier(s) must be "acceptable" in the sense of being  
30 compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

Pharmaceutical compositions those suitable for oral, rectal, nasal, topical (including buccal and sub-lingual), vaginal or parenteral (including intramuscular, sub-

cutaneous and intravenous) administration, or in a form suitable for administration by inhalation or insufflation.

The chemical compound of the invention, together with a conventional adjuvant, carrier, or diluent, may thus be placed into the form of pharmaceutical compositions and unit dosages thereof, and in such form may be employed as solids, such as tablets or filled capsules, or liquids such as solutions, suspensions, emulsions, elixirs, or capsules filled with the same, all for oral use, in the form of suppositories for rectal administration; or in the form of sterile injectable solutions for parenteral (including subcutaneous) use. Such pharmaceutical compositions and unit dosage forms thereof may comprise conventional ingredients in conventional proportions, with or without additional active compounds or principles, and such unit dosage forms may contain any suitable effective amount of the active ingredient commensurate with the intended daily dosage range to be employed. Compositions containing ten (10) milligrams of active ingredient or, more broadly, 0.1 to one hundred (100) milligrams, per tablet, are accordingly suitable representative unit dosage forms.

The chemical compound of the present invention can be administrated in a wide variety of oral and parenteral dosage forms. It will be obvious to those skilled in the art that the following dosage forms may comprise, as the active component, either a chemical compound of the invention or a pharmaceutically acceptable salt of a chemical compound of the invention.

For preparing pharmaceutical compositions from a chemical compound of the present invention, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents, flavouring agents, solubilizers, lubricants, suspending agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component.

In tablets, the active component is mixed with the carrier having the necessary binding capacity in suitable proportions and compacted in the shape and size desired.

The powders and tablets preferably contain from five or ten to about seventy percent of the active compound. Suitable carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and 5 the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component, with or without carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid forms suitable for oral 10 administration.

For preparing suppositories, a low melting wax, such as a mixture of fatty acid glycerides or cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogenous mixture is then poured into convenient sized moulds, allowed to cool, and thereby to solidify.

15 Compositions suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or sprays containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

Liquid preparations include solutions, suspensions, and emulsions, for example, water or water-propylene glycol solutions. For example, parenteral injection 20 liquid preparations can be formulated as solutions in aqueous polyethylene glycol solution.

The chemical compound according to the present invention may thus be formulated for parenteral administration (e.g. by injection, for example bolus injection or continuous infusion) and may be presented in unit dose form in ampoules, pre-filled 25 syringes, small volume infusion or in multi-dose containers with an added preservative. The compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilising and/or dispersing agents. Alternatively, the active ingredient may be in powder form, obtained by aseptic isolation of sterile solid or by lyophilisation from 30 solution, for constitution with a suitable vehicle, e.g. sterile, pyrogen-free water, before use.

Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavours, stabilising and thickening agents, as desired.

Aqueous suspensions suitable for oral use can be made by dispersing the 5 finely divided active component in water with viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, or other well known suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such 10 liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavours, stabilisers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

For topical administration to the epidermis the chemical compound 15 according to the invention may be formulated as ointments, creams or lotions, or as a transdermal patch. Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening and/or gelling agents. Lotions may be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents, stabilising agents, dispersing agents, 20 suspending agents, thickening agents, or colouring agents.

Compositions suitable for topical administration in the mouth include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert base such as gelatin and glycerin or sucrose and acacia; and mouthwashes comprising the active 25 ingredient in a suitable liquid carrier.

Solutions or suspensions are applied directly to the nasal cavity by conventional means, for example with a dropper, pipette or spray. The compositions may be provided in single or multi-dose form. In the latter case of a dropper or pipette, this may be achieved by the patient administering an appropriate, predetermined 30 volume of the solution or suspension. In the case of a spray, this may be achieved for example by means of a metering atomising spray pump.

Administration to the respiratory tract may also be achieved by means of an aerosol formulation in which the active ingredient is provided in a pressurised pack

with a suitable propellant such as a chlorofluorocarbon (CFC) for example dichlorodifluoromethane, trichlorofluoromethane, or dichlorotetrafluoroethane, carbon dioxide, or other suitable gas. The aerosol may conveniently also contain a surfactant such as lecithin. The dose of drug may be controlled by provision of a metered valve.

5        Alternatively the active ingredients may be provided in the form of a dry powder, for example a powder mix of the compound in a suitable powder base such as lactose, starch, starch derivatives such as hydroxypropylmethyl cellulose and polyvinylpyrrolidone (PVP). Conveniently the powder carrier will form a gel in the nasal cavity. The powder composition may be presented in unit dose form for example in  
10 capsules or cartridges of, e.g., gelatin, or blister packs from which the powder may be administered by means of an inhaler.

In compositions intended for administration to the respiratory tract, including intranasal compositions, the compound will generally have a small particle size for example of the order of 5 microns or less. Such a particle size may be obtained by  
15 means known in the art, for example by micronization.

When desired, compositions adapted to give sustained release of the active ingredient may be employed.

The pharmaceutical preparations are preferably in unit dosage forms. In such form, the preparation is subdivided into unit doses containing appropriate  
20 quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packaged tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

25        Tablets or capsules for oral administration and liquids for intravenous administration and continuous infusion are preferred compositions.

### **Biological Activity and Methods of Treatment**

4-aminobutyric acid (GABA) is the major inhibitory neurotransmitter which  
30 has been shown to act throughout both the central and peripheral nervous system. At present two types of GABA receptors are known, the GABA<sub>A</sub> and the GABA<sub>B</sub> receptors. Recent molecular biology has demonstrated that the GABA<sub>A</sub> receptors can be subdivided into numerous subreceptors consistant with the selective and or partial

pharmacological effects observed with certain benzodiazepine receptor ligands as opposed to the unselective effects observed for the classical benzodiazepine receptor ligands such as for example diazepam.

Activation of GABA receptors leads to alterations in membrane potential 5 (hyperpolarization). The GABA<sub>A</sub> receptors are associated with chloride influx through its associated and integrated chloride channel, whereas GABA<sub>B</sub> receptor activation indirectly alters potassium and calcium channels as well as modifies second messenger production. The GABA<sub>A</sub> recognition sites can be activated by GABA, muscimol, and isoguvacine for example, but not by GABA<sub>B</sub> agonists such as for 10 example baclofen. The modulatory GABA<sub>A</sub> recognition site at the benzodiazepine receptor sites can be selectively radiolabelled with <sup>3</sup>H-flunitrazepam.

The affinity of various potential ligands for the benzodiazepine receptor sites can thus be evaluated by estimating the ability of test compounds to displace <sup>3</sup>H-flunitrazepam.

15 The compounds of the present invention may be useful for the treatment of disorders or diseases of a living animal body due to their modulatory effect on the benzodiazepine recognition site of the GABA<sub>A</sub> receptor complex. This property make the compounds of this invention extremely useful as muscle relaxants and in the treatment of convulsions, anxiety, sleep disorders, anaesthesia, memory disorders as 20 well as other disorders sensitive to modulation of the GABA<sub>A</sub> receptor.

Accordingly, the compounds of the present invention may be administered to a subject, including a human, in need of treatment, alleviation, or elimination of a disorder or disease associated with GABA<sub>A</sub> receptors. This includes especially convulsions, anxiety, sleep disorders, anaesthesia, and memory disorders.

25 It is at present contemplated that a suitable dosage range is of from about 0.01 to about 100 mg per day, more preferred of from about 0.1 to about 50 mg per day, most preferred of from about 0.1 to about 30 mg per day, dependent, however, upon the exact mode of administration, the form in which it is administered, the indication towards which the administration is directed, the subject involved and the 30 body weight of the subject involved, and further the preference and experience of the physician or veterinarian in charge.

**Methods of Preparation**

The novel benzimidazole derivatives of the invention may be prepared by conventional methods of chemical synthesis, e.g. those described in the working examples. The starting materials for the processes described in the present application are known or may readily be prepared by conventional methods from commercially available chemicals.

The end products of the reactions described herein may be isolated by conventional techniques, e.g. by extraction, crystallisation, distillation, chromatography, etc.

**Example 1**  
**Preparatory Example**

4-Fluoro-3-nitroacetophenone (1b): Concentrated sulfuric acid (200ml) is cooled to 5°C. 4-Fluoroacetophenone (20ml, 0.16mol) is added keeping the temperature below 10°C. The mixture is cooled to 0-5°C and potassium nitrate (25g, 0.25mol) is added portionwise over 2 hours keeping the temperature within this range. Following the addition the mixture is stirred in the cold for additionally 2 hours. The mixture is poured on ice (600g) and the crude product is filtered off. Column-chromatographic purification on silica gel using a mixture of ethyl acetate and petroleum ether (1:9) as the eluent affords pure 1 (18.2g, 60%). Mp 48-49°C.

**Example 2**  
**Preparatory Example**

Ethyl 4-chloro-3-nitrobenzoate (1c): 4-chloro-3-nitrobenzoic acid (40.0 g, 0.2 mol) was refluxed in thionyl chloride (150 ml) for 6 hours. After cooling toluene (50 ml) was added and the mixture was evaporated to dryness. Abs. ethanol (500 ml) was added to the cooled residue, and the resulting mixture was refluxed overnight. The excess of ethanol was removed under reduced pressure and the product crystallized upon addition of aqueous sodium bicarbonate (1M). Yield: 42.5 g (93%).

**Example 3**  
**Preparatory Example**

4-Fluoro-1-iodo-3-nitrobenzene (1g): A vigorously stirred suspension of 4-fluoro-3-nitroaniline (25 g, 0.16 mol) in conc. hydrochloric acid (125 ml) was cooled to -15°C. A solution of sodium nitrite (12.1 g, 0.18 mol) in water (25 ml) was added drop-wise keeping the temperature at -15°C. Following the addition the mixture was stirred for 15 min whereafter a solution of potassium iodide (33.4 g, 0.2 mol) in water (65 ml) was added over 45 min. At the end of the addition the mixture was stirred for additionally 30 min at ambient temperature. Aqueous sodium sulfite (1M) was added to remove iodine and the resulting mixture was extracted thrice with diethyl ether. The combined extracts were successively washed with ice-cold aqueous sodium hydroxide (1M) and brine, dried over sodium sulfate and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel, using a mixture of

ethyl acetate and petroleum ether (1:9 v/v) as the eluent, to yield the desired product (30.3 g, 71%) as a yellowish oil.

**3-(4-Fluoro-3-nitrophenyl)furan (1d):** A mixture of **1g** (25 g, 94 mmol), 3-furanyl-boronic acid (13.1 g, 117 mmol), potassium carbonate (38.8 g, 281 mmol), 1,3-5 propanediol (33.8 ml, 468 mmol) and tetrakis(triphenylphosphine)-palladium(0) (0.5 g) in a mixture of 1,2-dimethoxyethane passed through Al<sub>2</sub>O<sub>3</sub> to remove peroxides (100 ml) and water (50 ml) was heated to reflux under nitrogen for 1 hour. The progress of the reaction was monitored by TLC using a mixture of ethyl acetate and petroleum ether (1:9 v/v) as the mobile phase. The mixture was poured into ice-water (500 ml).  
10 The precipitate was filtered off, washed with water and dissolved in ethyl acetate (200 ml). This solution was washed with cold 1 M HCl (3 × 100 ml) and brine. The organic phase was dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness to leave a crude product (100%). The crude product was dissolved in a mixture of dichloromethane and petroleum ether (1:1, v/v) and filtered through a short column (1.5 g silica gel per gram  
15 crude product). The column was washed with the above mixture (20 ml per gram crude product). The solvent was removed under reduced pressure and the residue was recrystallized (60°C → 0°C) from 2-propanol (4 ml per gram residue).

Yield: 80%. M.p. 74.3-74.9°C. <sup>1</sup>H NMR (DMSO-d<sub>6</sub>): 7.11 ppm (s, 1H), 7.64 ppm (dd, 1H), 7.80 ppm (s, 1H), 8.06 ppm (m, 1H), 8.36 ppm (dd, 1H), 8.39 ppm (s, 20 1H).

**4-Fluoro-3-nitrobiphenyl (1e)** was prepared analogously from **1g** and phenylboronic acid.

#### Example 4

##### 25 Preparatory Example

**4-Fluoro-3-nitro-t-butylbenzene (1f):** To a cold (5°C) suspension of 4-t-butylaniline in a mixture of conc. hydrochloric acid (25 ml) and water (25 ml) was added a solution of sodium nitrite (7.6 g, 0.11 mol) in water (10 ml) keeping the temperature at 5-7°C. At the end of the addition, the mixture was stirred for additionally 15 min, whereafter a solution of sodium tetrafluoroborate (15.4 g, 0.14 mol) in water (30 ml) was added dropwise, maintaining the temperature at 5-8°C. After another 15 min at 5°C the diazonium salt was filtered off, dried with suction and washed with diethyl

ether (yield: 21 g). The diazonium salt was decomposed by gentle heating to 120°C on an oil-bath. The product was distilled off and collected to yield **1f** (11.2 g, 73.5%).

#### Biological Activity

Tissue Preparation: Preparations are performed at 0-4°C unless otherwise indicated.

Cerebral cortex from male Wistar rats (150-200 g) is homogenized for 5-10 sec in 20 ml Tris-HCl (30 mM, pH 7.4) using an Ultra-Turrax homogenizer. The suspension is centrifuged at 27,000 x g for 15 min, and the pellet is washed three times with buffer (centrifuged at 27,000 x g for 10 min). The washed pellet is homogenized in 30 20 ml of buffer and incubated on a water bath (37°C) for 30 min to remove endogenous GABA and then centrifuged for 10 min at 27,000 x g. The pellet is then homogenized in buffer and centrifuged for 10 min at 27,000 x g. The final pellet is resuspended in 30 ml buffer and the preparation is frozen and stored at -20°C.

Assay: The membrane preparation is thawed and centrifuged at 2°C for 10 min at 27,000 x g. The pellet is washed twice with 20 ml 50 mM Tris-citrate, pH 7.1 using an Ultra-Turrax homogenizer and centrifuged for 10 min at 27,000 x g. The final pellet is resuspended in 50 mM Tris-citrate, pH 7.1 (500 ml buffer per g of original tissue), and then used for binding assays. Aliquots of 0.5 ml tissue are added to 25 µl of test solution and 25 µl of  $^3\text{H}$ -FNM (1 nM, final concentration), mixed and incubated for 40 min at 2°C. Non-specific binding is determined using clonazepam (1 µM, final concentration). After incubation the samples are added 5 ml of ice-cold buffer and poured directly onto Whatman GF/C glass fibre filters under suction and immediately washed with 5 ml ice-cold buffer. The amount of radioactivity on the filters is determined by conventional liquid scintillation counting. Specific binding is total binding minus non-specific binding.

The test value is calculated as the IC<sub>50</sub> (the concentration (nM) of the test substance which inhibits the specific binding of  $^3\text{H}$ -FNM by 50%).

### Example 38

#### Biological Activity

##### In vivo inhibition of $[^3\text{H}]$ flunitrazepam ( $[^3\text{H}]$ FNM) Binding

$[^3\text{H}]$ FNM can be used for *In vivo* receptor labelling studies in mouse.

30 Accumulation of  $[^3\text{H}]$ FNM binding will occur all over the brain as GABA<sub>A</sub> receptors are widely distributed. The specific binding of  $[^3\text{H}]$ FNM can be partly or completely prevented by simultaneous or prior administration of pharmacologically active benzodiazepines or by some benzodiazepine-like compounds.

Method: All test substances used are solutions prepared in 10% Tween 80.

35 Groups of three female NMRI mice (25g) are injected i.v. via the tail vein with 5.0mCi of  $[^3\text{H}]$ FNM in 0.2 ml saline. 15 min. after injection with  $[^3\text{H}]$ FNM the test substance is administered i.v. Twenty min after injection with  $[^3\text{H}]$ FNM, mice are killed by decapitation, the forebrains rapidly excised and homogenized in 12 ml of ice-cold 50 mM Tris-citrate, pH 7,1 using an Ultra-Turrax homogenizer. Three aliquots of 1 ml are

immediately filtered through GF/C glass fiber filters and washed with 2 x 5 ml of ice-cold buffer.

The amounts of radioactivity on the filters and in 200 mL of the homogenate are determined by conventional scintillation counting. Groups of untreated mice serve  
5 as controls.

To determine non-specific binding groups of mice are injected with clonazepam (25 mg/kg) i.p. 10 min before [<sup>3</sup>H]FNM injection. Specific binding is the amount of binding in controls minus the amount of binding in clonazepam treated mice.

10       Results: The ED<sub>50</sub> value is determined from dose response curves. The results show that the compounds of the present invention have a very favorable kinetic behavior.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/DK 97/00462

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: 13-15  
because they relate to subject matter not required to be searched by this Authority, namely:  
**Remark:** Although claim(s) 13-15  
is(are) directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2.  Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
